

FCM Cyber and Information Security Statement

Author: Julia Harris – Information Security Assurance and Compliance Director

25 May 2021

1.0 Final

1. Overview

1.1 Goal

At FCM our customers are our greatest priority and for this reason managing Cyber and Information Security risks are at the heart of everything we do. This document is intended to give an overview of our approach to information security to give confidence to our clients and travellers that their data is in safe hands.

This statement is presented based on ISO/IEC 27001 which is the leading international standard for information security management systems (ISMS). Worldwide, organisations implement and maintain an Information Security Management System (ISMS) to protect data that is crucial to their businesses, mitigate risk and ensure stable operations, and to provide confidence to stakeholders and customers. The standard is grouped based on Control Sets, which are the topics contained within it.

FCM are either certified to this standard or working towards achieving this across our key markets globally.

FCM are also working towards gaining System and Organisation Controls 2 (SOC 2) which is a comprehensive reporting framework created by the American Institute of Certified Public Accountants (AICPA) in which independent, third-party auditors perform an assessment and subsequently test controls relating to the Trust Services Criteria (TSC) of Security, Availability, Processing Integrity, Confidentiality or Privacy across our core systems within our Travel Technology platform. This will provide confidence to our clients and travellers that FCM are committed to taking steps to ensure systems, in which their data is held, are appropriately and consistently protected against cyber and information security threats.

2. Control Set Statements

2.1 Information Security Policies

FCM has a set of security policies which flow down from an Information Security Statement which is signed by our most senior Executive. This statement shows that Information Security has the support and backing of the most senior managers in our business, this support translates into an internal focus which ensures all staff work in a secure manner. There are then 15 policies which apply to all members of staff regardless

of their job role, plus a further 28 which cover HR and Information Technology Specific topics. The policy set includes the expected policies e.g. Acceptable Use, Remote Working, Risk Assessment and Protective Marking to name but 4.

2.2 Organisation of Information Security

The Flight Centre Travel Group Board and Executive leaders of the organisation have assigned responsibility for Information Security to our Group Chief Information Security Officer (CISO) to oversee Flight Centre's Information Security risk management practices, Strategy and Policy. The CISO is also supported by a global team to provide information security advice, guidance and support to all business areas, including the monitoring of Information Security risks, the threat landscape and that controls continue to operate effectively thus ensuring adequate maintenance of Security practices across the business. The CISO regularly reports to the Executive Leadership team, Board and Risk and Audit Committee on matters regarding cyber and information security.

2.3 Human Resource Security

FCM has differing processes for on-boarding individuals across the globe, but where possible (i.e. within local legislation) this meets the principles of the Baseline Personnel Security Standard (BPSS) created by the UK government to define the minimum requirements to be checked before an employee is on boarded. This includes verification of the identity of the potential employee, the right to work in the country, and verification of the last 3 years of employment through reference uptake, it also covers a criminal record check, where allowed. FCM also have policies on what must be done when an employee resigns or leaves the business including risk assessments on when access should be removed.

FCM has a centralised platform for delivering training to all employees, there are mandatory courses for any new employee to complete in their first couple of weeks, this includes several modules which cover their Information Security responsibilities, how to work securely, and on how to spot things like phishing and other internet based threats. There are also requirements to repeat this training on an annual basis, plus augmented training if new threats arise that require communication across all employees.

2.4 Asset Management

FCM maintain an inventory of systems and platforms within which customer data is stored or processed, and processes that articulate how employees are expected to treat our data or data entrusted to us. We have asset repositories which detail who owns each item of data and other details relevant to that asset.

FCM also have a protective marking policy which details how each classification is to be treated, and with whom each category can be shared.

FCM also operate different controls for protection of data on mobile devices, including controls to prevent data based on classification on from leaving the organisation, and remote wipe capabilities should a device be reported lost or stolen. All portal devices that have access to FCM data must be encrypted. FCM utilise products such as Airwatch, Microsoft InTune, and Bitlocker to help achieve these control objectives.

2.5 Access Control

FCM operate Role Based Access Control (RBAC) for our key systems and the access is audited. For lower risk systems it is a mix of RBAC and Access Control Lists (ACLs). This means that employees and customers only have access to systems and data for which they have a need. All Systems have an Asset Owner associated with them. Asset owners will determine the rules, rights and restrictions on user access to their assets based on the user requirements and associated security risks. The business requirements must be clearly stated in advance for the direct benefit of both users and service providers before access is granted. Other requirements are defined in the Access Control Policy.

FCM have strong controls around all external access to our systems which is supported by two factor authentication, this means that not only does a person have to have a valid logon and password, but also access to a secondary application which provides a onetime code to allow access to proceed.

FCM have information classification and information marking policies in place to ensure the correct levels of protection are afforded to our most valuable data.

2.6 Cryptography

FCM encrypt data at rest (where the risk requires) and in transit and have processes and procedures for key management and storage. We regularly review our standard to ensure that our encryption keys and ciphers are maintained and updated with industry practices, vulnerability disclosures and changes to our threat landscape.

2.7 Physical and Environmental Security

FCM also have Physical and Environmental Policies to protect our assets both physical and logical. This details what controls are required to be implemented to adequately protect physical locations where our assets and data are held. This approach covers people, processes and technology to ensure appropriate security is maintained within key sites. Examples include a clear desk policy, the application of data disposal and handling practices, visitor policies, tailgating, etc.

2.8 Operations Security

FCM have defined roles and responsibilities for the protection and maintenance of operational security controls including regular reviews to ensure that controls are designed and operating effectively. These processes and reviews are informed by threat intelligence with FCM taking an approach of continuous improvement. FCM monitor and mitigate risks associated with threats such as malware (i.e. Viruses and Ransomware) using technologies including end point detection and response, entity and user behaviour analytics and 24x7x365 SOC and threat hunting capabilities. FCM ensures suitable backup and disaster recovery processes are in place and regularly tested. FCM have a robust approach to vulnerability management with the technology landscape regularly scanned and patches promptly applied based on risk. FCM have a principle of security by design which informs the creation of new processes within our business, development and testing of any software strictly follows this principle.

2.9 Communications Security

FCM have policies which govern management of the security of networks, and requirements on perimeter controls which consider the risks of data traversing those links and perimeter locations. Our networks are extensive, and we have monitoring in place to ensure controls remain active and configured as required.

2.10 System Acquisition Development and Maintenance

FCM have a Systems Development Life Cycle policy which details how and when during the lifecycle of a development information security must be considered and put into practice. These first-line risk management processes are supported by second and third-line reviews including penetration tests as required. Static code analysis is conducted regularly using products such as Fortify and Sonarqube. Developers are subject to annual secure development training. The acquisition of any new system is subject to a security and privacy review conducted by the Corporate Security and Privacy team.

2.11 Supplier Relationships

FCM operate a framework covering our third party suppliers based on a risk assessment on each supplier. All suppliers are required to answer an annual questionnaire as a minimum, but for higher risk suppliers, we meet them regularly and also perform onsite audits for the highest risk.

2.12 Information Security Incident Management

FCM have a robust Incident management capability, of which Information or Cyber incidents form a major part. We also undertake exercises to practice our response in this area. FCM has a 24x7x365 Security Operations Centre and Threat Hunting capability monitoring our security health via our next generation Security Incident and Event Management platform, we have market leading incident response and forensic experts on retainer. FCM has recently rolled our endpoint detection and response capability across our business.

2.13 Business Continuity Management

FCM have well defined and maintained continuity capabilities, which are also tested on a regular basis.

2.14 Compliance

Within the department of the Group CISO there are assigned Compliance and Assurance roles across the globe in regard to Information Security. The legal department, supported by our Independent Privacy team, are based in all geographies and are responsible for tracking and ensuring compliance with local legislative requirements.

3. Document Information

3.1 Revision History

Version	Date	Author	Changes
0.1 Draft	30 Apr 2021		Original version
